Abstract: A new γ-lactone named maroccanin (1) together with 5 known compounds : scopoletin (2); 8α-[2'-
hydroxymethyl-2'-butenoyloxy]-dehydromelitensin (3); 11,13-dehydromelitensin (4); 8α-[2'-hydroxymethyl-2'-
butenoyloxy]-sonchucarpolide (5) and 5Hα,6Hβ,7Hα,15-hydroxy-8α-(1’,2’-dihydroxyethyl-acryloxy)-elema-
1(2),3(4),11(13)-trien-6,12-olide (6), were isolated from the chloroform soluble part of the aqueous-MeOH
extract of the flowering aerial parts of C. maroccana Ball. (Asteraceae), an endemic species of the North of the
Sahara. The structures were established by chemical and spectral analysis, mainly HR-ESIMS, HREIMS,UV
and NMR experiments (COSY, NOESY, HSQC and HMBC). The compounds 3 and 5 are new for the genus
Centaurea.

Keywords: Maroccanin; Sesquiterpene lactones; Centaurea maroccana; Asteraceae.

1. Plant Source

The species of the genus Centaurea are known for their antidiabetic, antidiarrhetic, antirheumatic, anti-inflammatory, colagog, choleric, digestive, stomachic, diuretic, menstrual, astringent, hypotensive, antipyretic and antibacterial effects by public medicals [1]. These species have been object of many phytochemical investigations which showed their wealth of bioactive

* Corresponding author: E- Mail: fbenayache@yahoo.fr, Phone +213-31818883.
secondary metabolites in particular flavonoids [2, 3] and sesquiterpene lactones [4-7]. As a part of our ongoing program of research of new molecules with potential biological activity from this genus [8-12], we report our results on *C. maroccana* Ball., an endemic species of the north of the Sahara [13]. The present work which concerned the chemical constituents of the chloroform soluble part of the leaves and flowers of *C. maroccana* Ball., led to the isolation of a new γ-lactone named maroccanin (1) together with 5 known compounds: a coumarin and 4 sesquiterpene lactones (Figure 1).

Flowering aerial parts of *Centaurea maroccana* Ball. were collected from the area of Biskra in the South of Algeria in April 2002 and authenticated by Prof. M. Kaabeche (Biology Department, University of Setif, Algeria). A voucher specimen (CCM12/04/02) has been deposited in the Herbarium of the Valorization of Natural Resources and Synthesis of Bioactive Substances Laboratory, Mentouri University, Constantine.

2. Previous Studies

In previous studies, we reported some compounds from the flowering aerial parts of this plant [14, 15]. The purpose of the present work was the isolation and the structure elucidation of further constituents

3. Present Study

Air-dried leaves and flowers (2700 g) of *C. maroccana* were macerated at room temperature with MeOH–H₂O (80:20, v/v) for 24 h, three times. After filtration, the filtrate was concentrated (1200 ml) and dissolved in H₂O (1100 ml) under magnetic agitation. The resulting solution was filtered and successively extracted with CHCl₃, EtOAc and n-butanol. The organic phases were dried with Na₂SO₄, filtered and concentrated *in vacuo* at room temperature to obtain the following extracts: chloroform (12.5 g), EtOAc (20 g) and n-butanol (40 g).

A part of the chloroform extract (9 g) was fractionated by CC on silica gel using chloroform with increasing percentages of acetone to yield 50 fractions (1-50) obtained by combining the eluates on the basis of TLC analysis. Fraction 10 (67 mg) and fraction 11 (45.5 mg) (99:1) were submitted to preparative TLC (benzene / EtOAc 5:1) and (chloroform / acetone, 9:1) respectively, to give the new compound 1 (10 mg) named maroccanin and scopoletin (2) (20 mg) [16] respectively. Fraction 27 (120 mg) (90:10), gave after purification on preparative plates of silica gel (chloroform / acetone, 6:1) 8α-[2’-hydroxymethyl-2’-butenoyloxy]-dehydrodimitensin (3) (6.1 mg) [17-19] and 11,13-dehydrodimitensin (4) (13.2 mg) [20]. Fraction 40 (200 mg) (80:20) was rechromatographed on a silica gel column using chloroform / acetone (4:1) as eluent to yield 4 sub-fractions. Sub-fraction 1 gave after purification on preparative TLC (silica gel, benzene / acetone, 1:1) 8α-[2’-hydroxymethyl-2’-butenoyloxy]-sonchucarpolide (5) (10 mg) [18]. Fraction 41 (150 mg) (70:20), was rechromatographed on a silica gel column using chloroform / EtOAc, 3:1 to yield five sub-fractions. Sub-fraction 4 gave after purification on preparative TLC (silica gel, benzene / EtOAc, 2:1) 5Hα,6Hβ,7Hα,15-hydroxy-8α-(1’,2’-dihydroxyethyl-acyroyloxy)-elema-1(2),3(4),11(13)-trien-6,12-olide (6) (20 mg) [21,22].

Maroccanin (I): Colourless oil; [α]D₂₀ = −66.5 (c = 0.0035, MeOH); ¹H NMR (500 MHz, CDCl₃): δ (ppm) = 1.27 (3H, s, H-10), 1.70 (1H, m, H-5b), 2.24 (3H, s, H-14), 2.30 (1H, m, H-5a), 2.48 (1H, m, H-6b), 2.51 (1H, brd, J = 6.1 Hz, H-7), 2.60 (1H, m, H-6a), 2.81 (1H, brq, J = 9.4 Hz, H-4), 3.07 (1H, dd, J = 9.4, 1.5 Hz, H-3), 4.83 (1H, d, J = 1.5 Hz, H-2), 6.22 (1H, d, J = 16.1, H-12), 6.54 (1H, dd, J = 16.1, 6.1 Hz, H-11); ¹³C NMR (125 MHz, CDCl₃): δ (ppm) = 9.4 (CH₂, C-10), 21.5 (CH₂, C-5), 27.2 (CH₃, C-14), 40.4 (CH₂, C-6), 41.7 (CH, C-4), 54.1 (CH, C-7), 55.2 (CH, C-3), 55.3 (C, C-8), 81.9 (CH, C-2), 136.0 (CH, C-12), 137.6 (CH, C-11), 177.5 (C, C-9), 197.0 (C, C-13), 213.0 (C, C-1); HRESI-MS: m/z 271.0940 (calcd. 271.0946 for C₁₄H₁₆O₄Na).
The new compound 1 was obtained as oil. The positive mode HRESI-MS spectrum presented [M+Na] ion at m/z 271.0940 (100%) according to the molecular formula C₁₄H₁₆O₄ (calculated for C₁₄H₁₆O₄Na: 271.0946) indicating a compound containing 7 unsaturations. The ¹H, ¹³C NMR, DEPT and HSQC spectra led to the presence of 2 CH₃, 2 CH₂, 6 CH from which 2 ethylenic and 1 oxygenated (δC 81.9; δH 4.83, d, J = 1.5 Hz) and 4 quaternary carbon atoms from which a carbonyl of a ketone at δC 213.0, a carbonyl of a conjugate ketone at δC 197.0 and a characteristic carbonyl of a γ-lactone at δC 177.5. The presence of the five membered cycle of the γ-lactone in this compound was confirmed by the observed correlation between this last carbonyl and the proton of the oxygenated CH group (δH 4.83) in the HMBC spectrum (Figure 2), the observed correlation between the proton of this CH (H-2) and the proton of the CH at δH 3.07 (dd, J = 9.4, 1.5 Hz) in the COSY spectrum and the observed correlations between the carbon of this last CH (C-3 at δ 52.2), the carbon of the lactone carbonyl and the protons of the CH₃ group at δH 1.27 (s, δC 9.4). The multiplicity of the signal of this CH₃ group suggested the presence of the quaternary carbon atom (δC 55.3) between C-3 and the carbonyl of the lactone.

The examination of the COSY spectrum showed correlation between H-3 and the proton of the CH group at δH 2.82 (br. q, J = 9.4, H-4), correlations between H-4 and the diastereotopic protons of the CH₂ group at δ 2.30 (m, H-5a) and δ 1.70 (m, H-5b) and correlations between these last two protons and the diastereotopic protons of the other CH₂ group of this molecule (δ 2.60, m, H-6a, δ 2.48, m, H-6b). In the HMBC spectrum, H-6a, H-6b and H-3 clearly showed correlations with the carbon of the ketone at δ 213.0. These observations led to the presence of a 2,3,4-trisubstitued cyclohexanone in this compound. According to this result, the C-2 and C-3 positions were occupied by the γ-lactone while the position C-4 was substituted by a C₅ chain which began by a CH group (δH 2.51 (br. d, J = 6.1 Hz, δC 137.6)) according to the HMBC correlations observed between the carbon of this group (C-7) and H-3, H-4 and H-5. Moreover, the proton of this group (H-7) correlated with the carbonyl of the lactone in the HMBC spectrum suggesting the presence of a bond between C-7 and the C₅ at δ 55.3 (C-8). In the COSY spectrum H-7 showed correlation with the ethylenic proton at δH 6.54 (dd, J = 16.1, 6.1 Hz, H-11, δC 137.6), which correlated with the second ethylenic proton (H-12, δH 6.22, d, J = 16.1 Hz, δC 135.1). In the HMBC spectrum H-11 showed correlations with the carbonyl of the conjugated ketone (C-13) and the carbon of the methyl group (C-14) at δC 27.2 (δH 2.25, s).

The stereochemistry of the chiral centers was assigned on the basis of the NOESY spectrum analysis. The NOESY interactions CH₃-10/H-3, CH₃-10/H-4, CH₃-10/H-7, H-3/H-7 and H-2/H-7 indicated a β-orientation for H-2, H-3, H-4, H-7 and CH₃-10 (Figure 3).
All these data led to the new molecule named maroccanin 1 as illustrated in Figure 1. Compounds 3 and 5 are reported for the first time from the genus Centaurea.
