#### 1. Experimental and Chemistry

#### 1.1. General experimental

Infra-red spectra were recorded on IR spectrophotometer (Perkin-Elmer 1430 ratio recording). HR-ESI mass spectra were determined using LC-TOF-MS (Shimadzu, Tokyo, Japan), HR-FAB-MS was determined using JEOL JMS 700 spectrophotometer (JEOL, Japan). NMR spectra was recorded on Bruker Ascend<sup>TM</sup> spectrometer (Bruker Daltonics, Bremen, Germany) at 400 MHz for <sup>1</sup>H and 100 MHz for <sup>13</sup>C, Bruker Advance DPX spectrometer (Bruker Daltonics Inc., MA, USA) at 600 MHz for <sup>1</sup>H and 200 MHz for <sup>13</sup>C and JEOL Eclipse NMR spectrometer at 500 MHz for <sup>1</sup>H; 125 MHz for <sup>13</sup>C where Chemical shifts were obtained I part per million (ppm) on the  $\delta$  scale with reference to the TMS resonance. Thin layer chromatography was performed on precoated silica gel 60 GF<sub>254</sub> ( $20 \times 20$  cm, 0.2 mm thick) on aluminum sheets and precoated RP-C18 F<sub>254</sub> plates (5 x 7.5 cm x 0.2 mm thick) on aluminium sheets (Merck Co., Darmstadt, Germany). Column chromatography was carried out using silica gel G 60-230 (Merck, Germany) packed by the wet method in the stated solvent, reversed phase chromatography using phase-bonded octadecylsilyl-silica gel (RP-C18, Merck, Germany), Sephadex LH 20 (Pharmacia Fine Chemicals, Sweden) and Diaion HP 20 (Mitsubishi Chemical Corporation, Japan). All the solvents used in column chromatography were purchased from El-Nasr Co. for Pharmaceutical Chemicals, Egypt. and Biochem Co., Egypt. Azino-bis-(3-ethyl benzthiazoline-6sulfonic acid) (ABTS), DPPH (2,2-diphenyl-1-picryl-hydrazyl-hydrate), TPTZ (2,4,6-tripyridyl-Striazine), Trolox (6-hydroxy-2,5,7,8-tetramethyl chromane 2-carboxylic acid),  $\alpha$ -glucosidase (Saccharomyces cerevisiae) and 3, 5 di-nitro salicylic acid (DNS) were obtained from sigma co., St. Louis, USA. Ascorbic acid (Cevarol<sup>®</sup>) tablets was obtained from Memphis Pharmaceutical Co., Cairo, Egypt. P-nitro-phenyl- $\alpha$ -D-glucopyranoside (p-NPG), sodium carbonate (Na<sub>2</sub> CO<sub>3</sub>), sodium dihydrogen phosphate, di-sodium hydrogen phosphate were purchased from Hi-Media, Mumbai, India. All the other chemicals and reagents used in the experiments were of analytical grade and were purchased from El-Nasr Co. for Pharmaceutical Chemicals, Egypt.

#### 1.2. Extraction and isolation:

The air dried powdered aerial parts of *Lactuca serriola* at the flowering stage (1Kg) were extracted by maceration with methanol 90% (7 × 2 L). After removal of the solvent under reduced pressure, the extract (180 g; 18% yield) was partitioned by petroleum ether, methylene chloride, ethyl acetate, and finally by *n*-butanol. The pet. ether fraction (34.94 g) was separated by column chromatography (CC) on silica gel column (78 × 4.5 cm, 500 gm) using a stepwise gradient elution from 100% pet. ether to 100% EtOAc. The effluent was collected in 250 mL fractions into (Fr. 1- 173). Fraction **A** (Fr. 26-29) eluted with pet. ether: EtOAc (92: 8) was left for crystallization to yield **1** (2.3 g). Fraction **B** (Fr. 39-44) eluted with pet. ether: EtOAc (90:10) was allowed to crystallize using CH<sub>2</sub>Cl<sub>2</sub>/MeOH (2:1) mix. to

yield **2** (120 mg). Fraction **C** (Fr. 83-86) eluted with pet. ether: EtOAc (82:18) was left for crystallization to give powder of **3** (12 mg). Fraction **D** (Fr. 130-140; 400 mg) eluted with pet. ether: EtOAc (60:40) was rechromatographed over silica gel column ( $40 \times 1.5$  cm) with CH<sub>2</sub>Cl<sub>2</sub>: EtOAc (88:12) to give **4** (26 mg). Fraction **E** (Fr. 167-169) eluted with pet. ether: EtOAC (10:90) was left for crystallization to give **5** (8 mg).

The methylene chloride fraction (10.42 g) was chromatographed using silica gel column (100 × 3.5 cm, 375 gm) by gradient elution from 100% CH<sub>2</sub>Cl<sub>2</sub> to 100% MeOH. The effluent was collected in 100 mL fractions into (Fr. 1- 287). Fraction **F** (Fr. 101-116; 263.6 mg) eluted with CH<sub>2</sub>Cl<sub>2</sub>: MeOH (98:2) was applied repeatedly over silica gel column ( $40 \times 1.5$  cm) with CH<sub>2</sub>Cl<sub>2</sub>: EtOAc (90:10) to give **6** (12 mg). Fraction **G** (Fr. 122-141; 231 mg) eluted with CH<sub>2</sub>Cl<sub>2</sub>: MeOH (98:2) was rechromatographed over silica gel column ( $35 \times 1.5$  cm) in isocratic manner using methylene chloride (100%) and collecting 15 mL each fraction to elute 1 (subfraction 21-25) & 2 (subfraction 80-100). These subfractions were further purified over sephadex LH20 column ( $40 \times 1$  cm) with MeOH to give **8** (2 mg) & **9** (11 mg) respectively. Fraction **H** (Fr. 185-213) eluted with CH<sub>2</sub>Cl<sub>2</sub>: MeOH (97:3) was washed with CH<sub>2</sub>Cl<sub>2</sub> and MeOH to yield powder of **7** (25 mg).

The EtOAc fraction (15.47 g) was loaded over silica gel column (90 × 3.5 cm, 300 gm) starting with pet. ether: EtOAc 80:20% then increasing gradient to 100% EtOAc to 100% MeOH. The effluent was collected in 250 mL fractions into (Fr. 1- 168). Fraction I (Fr. 10-14; 785.6 mg) eluted with pet. ether: EtOAc (60:40) was applied over silica gel column (38 × 1.5 cm) to elute (1'-3') subfractions with isocratic elution using CH<sub>2</sub>Cl<sub>2</sub>: EtOAc (93:7) and collecting 15 mL each fraction. Subfraction 1' (70-78) was further purified on sephadex LH20 column (22 × 1 cm) with MeOH (97:3) to yield 10 (11 mg). Sephadex LH20 column (20 × 1 cm) was used for subfraction 2'(80-90) purification to yield 11 (4 mg) with MeOH. Subfraction 3'(105-199) was rechromatographed over sephadex LH20 column (25 × 1 cm) with MeOH to yield 12 (3 mg) & 13 (5 mg) respectively. Fraction J (Fr. 83-90) was left for recrystallization from methanol to yield 15 (21 mg). The remaining part after crystallization was purified over sephadex LH20 column (36 × 1 cm) with CH<sub>2</sub>Cl<sub>2</sub>: MeOH (99:1) to yield 14 (7 mg).

The *n*-butanol fraction (15 g) was applied over Diaion HP 20 column ( $40 \times 4.5$  cm, 120 gm). The effluent was collected in 1000 mL fractions into (Fr. 1- 10). Fraction **K** (Fr. 3-4; 2.6 gm) eluted with H<sub>2</sub>O: MeOH (70:30)& (60:40) was re-chromatographed over Diaion HP 20 column ( $50 \times 1.5$  cm, collecting 100 mL fractions). Fraction (20-39) eluted with H<sub>2</sub>O: MeOH (93:17) was purified repeatedly over Sephadex LH20 column ( $38 \times 1$  cm) with MeOH to elute **16** (4mg), **17** (4.3 mg) respectively.

**Flowchart 2:** Phytochemical investigation of methylene chloride fraction of aerial part of *Lactuca serriola* 

Flowchart 3: Phytochemical investigation of ethyl acetate fraction of aerial part of Lactuca serriola

Flowchart 4: Phytochemical investigation of *n*-butanol fraction of aerial part of Lactuca serriola

#### **1.3. Biological Activity Assessments**

#### 1.3.1. Determination of $\alpha$ -Glucosidase Activity

α-Glucosidase inhibitory activity was carried out according to [1] with minor modifications. In a 96-well plate, reaction mixture containing 10 μL alpha-glucosidase (1 U/mL), 50 μL phosphate buffer (100 mM, pH = 6.8) and 20 μL of varying concentrations of extracts and compounds (1000 to 7.81 µg/mL) was preincubated at 37°C for 15 min. Then, 20 μL P-NPG (5 mM) was added as a substrate and incubated further at 37°C for 20 min. The reaction was stopped by adding 50 μL Na<sub>2</sub>CO<sub>3</sub> (0.1 M). The absorbance of the released p-nitrophenol was measured using Multiplate Reader at 405 nm. Acarbose at various concentrations 1000 to 7.81 µg/mL) was used as a standard. Wells without test substance was used as a control and each experiment was performed in triplicates. The results were expressed as percentage inhibition, which was calculated using the formula: **Inhibitory activity** (%) = (1 – A<sub>test</sub>/A<sub>control</sub>) ×100

#### 1.3.2. Determination of ABTS Radical Scavenging Activity

The assay was carried out according to [2] with minor modifications. The ABTS (2,2'-Azinobis(3-ethylbenzothiazoline-6-sulfonic acid) radical cation (blue-dark green) was prepared by mixing equal volumes of ABTS stock solution (colorless; 7 mM in distilled H2O) and  $K_2S_2O_8$  stock solution (potassium persulfate; 3.5 mM in distilled H2O). The mixture was allowed to stand in the dark at R.T. for 12-16 h until the reaction was complete. The ABTS <sup>+-</sup> solution was prepared by diluting the ABTS<sup>+-</sup> stock solution in pure EtOH to have an absorbance ( $A_{control}$ ) of 0.7±0.02 at a wavelength of 734 nm and was equilibrated with an incubator at 30 °C. Free radical scavenging activity was assessed by mixing 1.5 mL of the blue-green ABTS <sup>+-</sup> solution with 10 µL of the extract/ compound at various concentrations ranging from 10 to 60 µM (in distilled H2O, pure EtOH, or mixture of both of them). The change in absorbance at 734 nm was immediately monitored after 15 min ( $A_{test}$ ). Ascorbic acid was used as a standared. The decrease in absorbance can represent % inhibition which is calculated as follow: % inhibition = ( $A_{control} - A_{test}$ )/  $A_{control} X 100$ 

### 1.3.3. Determination of DPPH Radical Sscavenging Activity

The DPPH (2,2-diphenyl-1-picryl-hydrazyl-hydrate) free radical assay was carried out according to the method of [3]. 100  $\mu$ L of freshly prepared DPPH reagent (0.1% in methanol) were added to 100  $\mu$ L of the sample/ compound at various concentrations (dissolved in DMSO and diluted in methanol) in 96 wells plate (**n=6**), the reaction was incubated at room temperature for 30 min in dark. At the end of incubation time, the resulting reduction in DPPH color intensity was measured at 540 nm. Trolox was used as a standared. Data are represented as means ± SD according to the following equation: **% inhibition = (A**<sub>control</sub> **X 100** 

#### 1.3.4. Determination of Ferric Reducing Antioxidant Power (FRAP)

The ferric reducing ability assay was carried out according to the method of [4] with minor modifications to be carried out in microplates. A freshly prepared TBTZ reagent (300 mM Acetate Buffer (PH=3.6), 10 mM TBTZ in 40 mM HCl, and 20 mM FeCl<sub>3</sub>, in a ratio of 10:1:1 v/v/v, respectively). 190  $\mu$ L from the freshly prepared TPTZ reagent were mixed with 10  $\mu$ L of the extract/compound in 96 wells plate (**n=6**) where compound 10, 11, 14 at 1 mM, compound 12, 13, 15 at 0.166 mM, the MeOH and pet. ether extract at 2 mg/mL and the CH<sub>2</sub>Cl<sub>2</sub>, EtOAc and *n*-BuOH extract

at 0.333 mg/mL, the reaction was incubated at room temperature for 30 min in dark. At the end of incubation time the resulting blue color was measured at 593 nm. Data are represented as means  $\pm$  SD. Torolox stock solution of 10 mg/mL in methanol was used as standard at various concentrations from 500 to 7.8 µg/mL.
