Figure S1: Histological analysis of C57BL/6J mice groups' liver stained with Hematoxylin and Eosin stain (X100). Treated groups are (a) High fat diet, HFD; (b) Low fat diet, LFD; (c) Green tea total extract, HFD+GTE; (d) *M. cavendishii* total leaf extract, HFD+TLE; (e) *n*-Hexane fraction, HFD+Hex; (f) EA fraction, HFD+EA.

Figure S2: Histological analysis of liver from High Fat Diet (HFD). A: Hematoxylin and Eosin stain (X100) reveals near normal liver architecture with marked mainly macrovesicular steatosis in hepatocytes seen as clear unstained spaces. B: Oil Red O stain (X100), performed on frozen liver sections. Numerous large lipid droplets are seen within hepatocytes as red-stained dots. C&D: higher magnification of the previous two photomicrographs respectively (X200).

Figure S3: Histological analysis of liver from control group with normal diet. A: Hematoxylin and Eosin stain (X100) shows normal liver architecture. Some hepatocytes show microvesicular steatosis seen as minute clear unstained spaces. B: Oil Red O stain (X100), performed on frozen liver sections shows small red-stained fat droplets within hepatocytes as red-stained dots. C&D: higher magnification of the previous two photomicrographs respectively (X200).

Figure S4: Histological analysis of liver from treated with green tea total extract group with HFD. A: Hematoxylin and Eosin stain (X100) shows near-normal liver architecture with small clear unstained fat vacuoles as compared to HFD group. B: Oil Red O stain (X100), performed on frozen liver sections shows fewer and small red-stained fat droplets within hepatocytes compared to HFD group. C&D: higher magnification of the previous two photomicrographs respectively (X200).

Figure S5: Histological analysis of liver from group treated with *M. cavendishii* total extract. A: Hematoxylin and Eosin stain (X100) shows near-normal liver architecture with no fat vacuoles as compared to HFD group. B: Oil Red O stain (X100), performed on frozen liver sections shows fewer and small red-stained fat droplets within hepatocytes compared to HFD group. C&D: Higher magnification of the previous two photomicrographs respectively (X200)

Figure S6: Histological analysis of liver from group treated with the ethyl acetate fraction of *M. cavendishii*. A: Hematoxylin and Eosin stain (X200) shows normal liver architecture. Few hepatocytes show minute clear unstained spaces. B: Oil Red O stain (X100), performed on frozen liver sections shows small red-stained fat droplets within hepatocytes as red-stained dots. C&D: higher magnification of the previous two photomicrographs respectively (X200).

Figure S7: Histological analysis of liver from group treated with *n*-hexane fraction of *M. cavendishii*. A: Hematoxylin and Eosin stain (X100) shows near-normal liver architecture with small clear unstained fat vacuoles as compared to HFD group. B: Oil Red O stain (X100), performed on frozen liver sections shows few and small red-stained fat droplets within hepatocytes compared to HFD group. C&D: higher magnification of the previous two photomicrographs respectively (X200).

Figure S8: Representative CT images segmented for fat (axial, coronal and sagittal slices). A: *M. cavendishii* group CT, fat volume in blue, B: HFD CT, fat volume in blue, and C: LFD CT group, fat volume in blue.

Figure S9: Representative CT images segmented for fat (axial, coronal and sagittal slices). A: *n*-hexane fraction of *M. cavendishii* group CT, fat volume in blue. B: HFD CT, fat volume in blue, and C: LFD CT group, fat volume in blue.

Figure S10: Representative CT images segmented for fat (axial, coronal and sagittal slices). A: Ethyl acetate fraction of *M. cavendishii* group CT, fat volume in blue, B: HFD CT, fat volume in blue and C: LFD CT group, fat volume in blue.

Figure S11: Representative CT images segmented for fat (axial, coronal and sagittal slices). A: Green tea total extract group CT, fat volume in blue, B: HFD CT, fat volume in blue and C: LFD CT group, fat volume in blue.

Phytochemical investigation of the *n*-hexane fraction of *Musa cavendeshii*

The *n*-hexane extract (Hex) of *M. cavendeshii* (20 g) was fractionated over silica gel column (50 x 4.5 cm i.d., 300 g silica), using petroleum ether and eluted with *n*-hexane-EtOAc mixtures with increased polarity. Hundred mL fractions were collected and monitored by silica gel TLC [EtOAc-*n*-hexane, 1:9 v/v] or RP-18 TLC plates [MeOH-H₂O, 8.5: 1.5 v/v] and vanillin/sulfuric acid spray reagent. Similar fractions were pooled together, concentrated and subjected to further chromatographic fractionation.

Group 1 (54-62), 720 mg, eluted by 5% EtOAc, was re-chromatographed on RP-18 silica gel column (2.5 cm i.d. x 25 cm, 30 g) using water-methanol mixtures. Fractions, 10 mL, were analyzed RP-18 TLC [MeOH-H₂O, 8.5: 1.5 v/v]. Fractions 55-64, afforded compound **1** (12 mg, brown spot, R_f 0.85). Fractions 73-81, 68 mg, were re-chromatographed on medium pressure diol functionalized silica gel column (2.5 cm i.d. x 30 cm, 10 g, 3 mL/min). Elution was started with 100% *n*-hexane, 3 mL fractions were collected. Sub-fractions 50-80 eluted with *n*-hexane-EtOAc (99.5:0.5 v/v) contained compound **2** (3 mg, dark red, R_f 0.5) using RP-18 TLC, MeOH-H₂O (8.5: 1.5 v/v). Fractions 128-143, 80 mg, were chromatographed on medium pressure diol functionalized silica gel (2.5 cm i.d. x 30 cm, 10 g, and 3 mL/min). Elution was started with 100% *n*-hexane, 3 mL fractions were collected. Sub-fractions 50-73 eluted with *n*-hexane-EtOAc (99:1 v/v) were pooled together to give compound **3** (7 mg, violet to brown, R_f 0.25) using RP-18 TLC, MeOH-H₂O (8.5: 1.5 v/v).

Group 2 (70-77), 70 mg, eluted by 5% EtOAc, showed one major spots (R_f 0.20) using silica gel TLC and *n*-hexane-EtOAc (95:5 v/v). It was purified by crystallization from CH₂Cl₂-MeOH mixture to give compound **4** (55 mg, violet, R_f 0.30) using *n*-hexane-EtOAc (9:1 v/v).
